polylinker; Site_1: Not 1; Site_2: ECO RI; The
NIH_BMAP_M_S3.1 library is a subtracted library of a
series, ultimately derived from a mixture of individually
tagged normalized libraries from ten regions of the mouse
brain (cerebellum, brain stems, olfactory bulbs,
hypothalamus, cortex, amygdala, basal ganglia, pineal
gland, striatum, hipoccampus) after a series of
subtractions to reduce the representation of cDNAs from
which ESTs had already been generated. The following
serially subtracted libraries were generated in this
process: NIH_BMAP_M_S3.1, NIH_BMAP_M_S3.1) was constructed
as follows: PCRamplified CDNA inserts from NIH_BMAP_M_S2
clones from which 3' ESTs had been derived was used as a
driver in a hybridization with the NIH_BMAP_M_S2 library
in the form of single-stranded circles (subtracted library) was purified
by hydroxyapatite column chromatography, converted to
by hydroxyapatite column chromatography, converted to
by harder is a process of the column chromatography to the plant
determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. Seq primer: M13 Forward POLYA-No.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    bacteria (Liferechnologies) to generate the NIH,BMAP,M.S3.1 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:791-806, 1996)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         221 cageceageaacgetteaceeaggtetecgaegaactttteaagggggeeceaaetggg 280

/organism="Spratus norvegicus" / Strain="Spratus norvegicus" / Strain="Spratus norvegicus" / Strain="Spratus norvegicus" / Strain="Spratus norvegicus" / Clone_11D="UI.R-Y0-acg-9-07-0-UI" / Clone_11D="UI.R-Y0-acg-9-07-0-UI" / Clone_11D="UI.R-Y0-acg-9-07-0-UI" / Iab_host="Duling Life Technologies)" / Alab_host="Duling Life Technologies)" / Alab_host="Duling Life Technologies)" / Alab_host="Strein" in Strein of Isters is a subtracted library derived from an individually-tagged normalized whole-eye (mins the lens) library. The driver for the subtraction consisted of a pool of all previous libraris (UI-R-AO, UI-R-A), UI-R-EO, UI-R-EI, UI-R-CO, and UI-R-CI). The tag is a string of UI-R-EI, UI-R-CO, and UI-R-CI). The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dr track which allows identification of the library of origin of a clone within the mixture. The subtracted library of origin of a clone within the mixture. The subtracted library of origin of a clone within the mixture as under eye library in the form of single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-Y0 library. This procedure has been previously described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Email: msoares@blue.weeg.ulowa.edu

The Sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonsfide poly A tail. The Sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized corpus striatum library cDNA library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP CDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. Seq primer: MI3 Forward

                                                                                                                                                                                                                                                                                                                         -1- FUNCTION: CONFERS STRONG PROTECTION AGAINST CELL DEATH.
-1- BUNCTION: CONFERS STRONG PROTECTION AGAINST CELL DEATH.
-1- DEVELOWENTAL STAGE: DEVELOWENTAL REGULATION ONLY OCCURS IN THE BRAIN OF MID-METAMORPHOSIC TO POST-METAMORPHOSIC TADPOLES AND ADULTS, WHERE AN INCREASE OF SEVERAL FOLD HAS BEEN OBSERVED.
-1- SIMILARITY: CONTAINS A BCL-2 HOMOLOGY DOMAIN 1 (BH1).
-1- SIMILARITY: CONTAINS A BCL-2 HOMOLOGY DOMAIN 2 (BH2).
-1- SIMILARITY: BELONGS TO THE BCL-2 FAMILY.

-1- ALTERNATIVE PRODUCTS: TWO FORMS OF BCL-2: ALPHA, AND BETA, ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE. THEY ONLY DIFFER AT THEIR C-FERMINAL ENDS.
-1- TISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF TISSUES, WITH HIGHEST LEVELS IN REPRODUCTIVE TISSUES. IN THE ADULT BRAIN, EXPRESSION IS LOCALIZED IN MITRAL CELLS OF THE OLFACTORY BULL, GERREBELLAR GRANULE NEURONS OF HIPPOCAMPUS, PONTINE NUCLEI, CERREBELLAR GRANULE NEURONS, AND IN BPENDYMAL CELLS. IN PRENATAL BRAIN, EXPRESSION IS HIGHER AND LOCALIZED IN THE NEUROEPITHELIUM AND IN THE CORFICEAL PLATE.
-1- DOMAIN: BH4 DOMAIN SEEMS TO BE INVOLVED IN THE ANTI-APOPTOTIC
                                                                                                                                                                                                                                                                               Neuroscience 61:165-177(1994).

**PURCECON: PROLONGS THE SURVIVAL OF HEMATOPOIETIC CELLS IN THE ABSENCE OF REQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF VARIOUS STIMULI INDUCING CELLULAR DEATH. BCL2 BLOCKS APOPTOSIS BECAUSE IT INTERFERES WITH THE ACTIVATION OF CASPASES BY PREVENTING THE RELEASE OF CYTOCHROME C. MIGHT FUNCTION IN AN ANTIOXIDARY PARHWAY TO PREVENT APOPTOSIS AT SITES OF FREE RADICAL GENERATION SUCH AS MITOCHONDRIA.
                                                                         "Inity J.L., Tilly K.I., Kenton M.L., Johnson A.L.;
"Expression of members of the bcl-2 gene family in the immature rat ovary: equine chorionic gonadotropin-mediated inhibition of granulosa cell apoptosis is associated with decreased bax and constitutive bcl-2 and bcl-xhom messenger ribonucieic acid levels.";
Endocrinology 136:232-241(1995).
                                                                                                                                                                                                                                                                                                                                                                                                            SUBUNIT: FORMS HOMODIMERS AND HETERODIMERS TOGETHER WITH BAX AND
                                                                                                                                                                                                                                                                                                                                                                                                                           BAK PROTEINS, AND WITH BCL-X(S). HETERODIMERIZATION WITH BAX REQUIRES INTACT BHI AND BH2 DOMAINS, AND IS NECESSARY FOR ANTI-APOPTOTIC ACTIVITY (BY SIMILARITY).

Claim 2: Pages 25-26; 30pp; English.

The present sequence represents "Deprenyl" (RTM)-induced protein (DIP), an ovel protein in neural cells. This protein is induced by the neuroactive drug "Deprenyl" (RTM). DIP 1 and compounds which modulate its activity can be used for the diagnosis and treatment of neuroapoptosis; passociated with diseases such as Alzheimer's, Parkinson's and Huntington's, as well as cerebellar degeneration and oligodendrocyte sequence 225 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 6: Page 46: 75pp; English.

Dlocking or suppressing NF-kappa B (NF-kB) activation. A claimed method of genetically modifying a mammalian endothelial cell to method of genetically modifying a mammalian endothelial cell to cender it less susceptible to an inflammatory or other immunological stimulus comprises inscring into the cell; DNA encoding an anti-apoptotic protein able to inhibit NF-kB, and capperssing the cell such that NF-kB activation of the cell; DNA inhibited in the presence of the the cellular activating stimulus.

Sultable anti-apoptotic proteins include A20 (see W31528), BCL-2

C (see W31529), BCL-XL and A1 (see W3151) and their deletion mutants capable of inhibiting NF-kB, such as polypeptides comprising amino cald residues 5-24, 86-100, 129-148 and 180-195 of BCL-XL. Also cald are: (7), a mammalian endothelial cell modified by the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 77 AVKQALREAGDEFELRYRRAFSDLTSQLHITPGTAYQSFEQVVNELFRDGVNWGRIVAFF 136

In contrast, if they act as cell death stimulators, Rbcl-y and Hbcl-y may be used to treat conditions associated with prolonged cell life span such as cancer (especially kaposi's sarcoma and lung cancer) and auto/hyperimmune diseases. They may also be used to cause cell death in, and hence control, parasites.

This is the amino acid sequence of the cDNA clone Bc1-like (HAICH29), used in the method of the invention. The products of the clone can be used for treating conditions associated with abnormal expression of the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory alseases, various allergies, and as anti-infectious agents. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 FSDLAAQLHVTPGSAQQRFTQVSDELFQGGPNWGRLVAFFVFGAALCAESVNKEMEPLVG 120

The present sequence is described of a derivative of human Bcl-w
(see also Y05530), a pro-survival member of the Bcl-2 family that
is widely expressed and which is essential for spermatogenesis.

The invention relates generally to a method of treatment and to an immal model for the identification of molecules and genetic
animal model for the identification of molecules and genetic
animal model for the identification of infertility of male animals.

Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model
carries a mutation is at least one allele of the human or murine
bcl-w gene (see X25132-35) or in a gene associated with bcl-w.
Such animals have disorganised seminferous tubules and are
substantially infertile, but possess no other major abnormalities
as determined by histological examination. They can be used to
screen for therapeutic molecules including genetic sequences
capable of inducing, enhancing or otherwise facilitating
spermatogenesis in animals, or which can induce infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 QVQDWIVAXLETRLADWIHSSGGWADFTALYGDGALEDARRLREGNWA-VSTVVTGAVAL 179

```
This sequence represents a novel human protein, bcl-w, encoded by the bcl-2 gene family and extracted from an adult brain library. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rat bol-y protein; Rbol-y; human bol-y protein; Hbol-y; bol-2 homologue; programmed cell death; apoptosis; necrosis; cell death inhibitor; stroke; head trauma; Alzheimer's Disease; neural; muscular degenerative disease; multiple sclerosis; myocardial Infarction; vitally induced cell death; aging; spinal cord injury; amyotrophic lateral sclerosis; cancer; premature cell death; cell death stimulator; prolonged cell life span; Kaposi's sarcoma; lung cancer; autoimmune; hyperimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a mammalian bcy-1 protein.
The specification describes rat bcl-y protein (Rbcl-y) and human bcl-y protein (Rbcl-y). Rbcl-y and Hbcl-y are homologues of the bcl-2 protein thought to be involved in programmed cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y proteins may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, Alzheimer's Disease, neural and muscular degenerative diseases (especially multiple sclerosis), myocardial infarction, vitally induced cell death, aging, spinal cord injuries and amyotrophic lateral sclerosis- conditions where cells under go premature cell death as a result of triagers which may or may not be apparent. They may also be used in this way to develop cell lines which remain
                                                                                                                                                                                                                                                                                                                                                                 ij
